

CUSTOMIZING THE API FOR USER STORY REVIEWER

Objective: I am going to customized the workflow to accommodate the review for any user story that is added to the JIRA.

Step 1:

Navigate to API access under share option.

Step 2:

Navigate to Input Schema.

Step 3:

I have enabled 3 input schema. From the API - the actual body of the payload, Temperature, Models can be changed from the API.

	Method	The HTTP method to use.	POST
	Body	The body The HTTP method to use. request as a dictionary (for POST, PATCH, PUT).	 Open table
	Temperature	Run inference with this temperature. Must by in the closed interval [0.0, 1.0].	0.10  Precise  Creative
	Groq API Key	API key for the Groq API.	GroqAPIKey x

Step 4:

Copy the cURL – Mac OS/Linux and import it in the postman

Step 5:

Check for Tweaks in the request body. This is where we can change the payload

```
input_type": "text",
"tweaks": {
  "APIRequest-AT7J4": {
    "body": [
      {
        "key": "jq1",
        "value": "Key=\"US-2\""
      },
      {
        "key": "fields",
        "value": "[\"key\", \"summary\", \"description\", \"status\", \"reporter\", \"Acceptance Criteria\"]"
      }
    ]
  }
}
```

Step 6:

I am checking for 2 outputs. User story US-2 and US-3

The image displays two screenshots of a REST client interface, likely Postman, showing the results of API requests. Both screenshots show a 'raw' request body and a 'JSON' response body.

Top Screenshot (US-2):

- Request Body (raw):** A JSON object with a 'tweaks' property containing an 'APIRequest-AT7J4' object. This object has a 'body' array with two items: one for 'jq1' with value 'Key="US-2"' and one for 'fields' with value '["key", "summary", "description", "status", "reporter", "Acceptance Criteria"]'.
- Response Body (JSON):** A JSON object with 'session_id' and 'outputs'. The 'outputs' array contains an object with 'inputs' (empty), 'outputs' (empty), and 'results'. The 'results' object has a 'text' property with a 'text_key' of 'text' and a 'data' property containing an HTML snippet for 'Wards Dashboard Nurse Activities - User Story Review'.

Bottom Screenshot (US-3):

- Request Body (raw):** Similar to the top screenshot, but the 'value' for 'jq1' is 'Key="US-3"'.
- Response Body (JSON):** Similar to the top screenshot, but the 'data' property in the 'text' object contains an HTML snippet for 'Daycare Nurse Activities Raise - User Story Review'.
